

1. **SETUP:**

- a. Prerequisites:
 - i. Python(>=3.8)
 - ii. Django
 - iii. MySQL
 - iv. pip
- b. Clone Repo from Github: url to repo: [github repo](#)
- c. Create a Virtual Environment in your PC according to the OS.
- d. Install all the dependencies from requirements.txt in the Repo.
- e. Database setup:
 - i. Login to your MySQL db and then simply create the DB using CREATE command.
 - ii. Please note based on your db name change the db name in settings.py in django project.
- f. Setup django project:
 - i. Inside activated VE start a django project and django app.
 - ii. Navigate to the project folder to find settings.py where you would have to add you "app" and "rest_framework" into installed apps section
 - iii. Similarly in the DB section you can configure your DB as per your setup.
- g. Open a terminal navigate to the manage.py file in the django project folder and run the migrations using python manage.py runmigrations.
- h. Running migrations will setup the connected database and create the tables that you would have listed in the models.py of django project.
- i. Create a super user if you want to utilise django's built in admin UI for better user friendliness.
